

What is Professional Wetcleaning?

Wetcleaning

Professional Wet Cleaning is the most commercially available non-toxic alternative to dry cleaning. It is an aqueous process for cleaning a full range of garments using state of the art technology, biodegradable detergents and additives, followed by appropriate drying and restorative finishing procedures.

Professional Wet Cleaning: The Cleaning Process

Professional wet clean washers use a computer to control the rotation of the cleaning drum in order to minimize agitation while providing sufficient movement for effective garment cleaning. Wet clean washers are also equipped with a computer programmed detergent injection system, which allows the cleaner to specify the amount and type of wet clean detergent used for each load.

Biodegradable wet clean detergents have been formulated by detergent manufacturers to maximize cleaning power while minimizing color change and shrinkage.

Wet clean dryers include computer controls to assure that garments retain a proper amount of moisture after the dry cycle is complete.

Specialized tensioning pressing machines are used to enhance the restoration of constructed garments, such as suit jackets, suit pants, and tailored items.

Both equipment and operating costs are lower in wet cleaning compared to PCE dry cleaning. Cleaners who have switched are still able to process the same range of garments and materials as they did in the past.

The logo for Fabritec Brand Detergent features the word "Fabritec" in a large, light blue, stylized font with a registered trademark symbol (®) to its upper right. Below it, the words "Brand Detergent" are written in a smaller, light blue, sans-serif font. The entire logo is set against a light blue, circular gradient background.
